

Ignite Managing Woodlands for Woodfuel

At a glance...

Customised Provision

Duration Notes:	1 day
Recognised by:	Lantra Awards

Introduction

Gain an understanding of how to manage woods for woodfuel with this training course.

Overview in brief

This Lantra-accredited Customised Award is exclusively developed and delivered by a Lantra-approved Training Provider, who meets our quality standards. The course is specifically tailored to meet learners' needs. For further details about the course content and delivery locations, please contact the Training Provider using the details provided below.

The minimum age to undertake this course is 16.

Ignite is an innovative training programme of practical seminars and interactive workshops with a focus on woodfuel.

It is designed for those wanting to know more about woodfuel and to equip new and existing woodfuel businesses with the skills and knowledge required to meet the increasing demand from this growing alternative market.

With oil at high prices and concerns over supply, many people are increasingly going back to wood.

Advances in boiler technology and the introduction of woodchips and pellets as fuel sources, have seen a dramatic increase in the uptake of wood fuelled heating systems in recent years.

The finer details

The Ignite: Managing Woods for Woodfuel course focuses on planting, managing and harvesting woodlands for use as woodfuel.

What timber is suited to what type of woodfuel (logs or chips), assessing woodlands, measuring timber, harvesting, extraction, conversion and the economic modelling of timber harvesting and woodfuel conversion are covered in this one day course.

Who should attend?

Ignite courses are aimed at anyone involved in the woodfuel supply chain sector, whether they be woodfuel users, specifiers, processors, growers or woodland owners.

What will be covered?

Morning Sessions:

Session 1 – Welcome and Introduction.

Session 2 – Management Systems:

This session includes a general introduction to woodland types and the management regimes that can be applied to these woodland types. We introduce the concept of the common silvicultural systems used in UK forestry and particularly those used for small, unmanaged and undermanaged woodlands.

Session 3 – Crop Assessment:

This session introduces the methods behind assessing woodlands in terms of suitability for the different management systems that can be applied. We look at techniques for measuring standing timber for volume assessments using the abbreviated tariffing technique, and go on to discuss timber qualities and what may constitute timber that could go to non woodfuel markets (such as sawlogs and fencing grade material) and what is more suited to woodfuel markets.

Afternoon Sessions

E awards@lantra.co.uk

Coventry, Warwickshire, CV8 2LG

The afternoon will be made up of practical site visits including in-forest timber measurements and a visit to local woodlands. This will then be followed by two further sessions which will include a final exercise that will combine all of the day's information.

Session 4 – Harvesting and Extraction:

This session introduces the common harvesting and extraction techniques, machinery and equipment in use in the UK today and what situations they are best applied to. It covers motor manual and mechanised harvesting techniques and the many different types of timber extraction system.

Session 5 – Conversion:

This session looks at how timber felled and extracted can then be processed into woodfuel, focusing on firewood and woodchip production. We discuss timber quality and how this affects the woodfuel product chosen, and indeed its quality, and we look at moisture content and its effect on energy content. Here we also cover seasoning techniques, production methods and quality assurance.

We finish the session with a look at how to maintain compliance with the woodfuel legal and sustainability requirements for the Renewable Heat Incentive and how to register on and maintain compliance with the Biomass Suppliers List for both self-suppliers and producer traders. Throughout the course participants are encouraged to contribute their own experience either of woodfuel or of other aspects of renewable to the course.
